HDR Japan features high dynamic range images of Japan.

HDR, or high dynamic range, photography is the craft of bracketing a series of photos. then carefully merging the bracketed images back into an .hdr or .exr file format. After being merged, the file is then tonemapped back to an 8- or 16-bit image.

What's the potential result? A beautifully detailed and carefully crafted HDR image with a style and elegance all its own. Using this technique to capture a scene can allow you to view the world as never before. HDR Japan is member contributed photo resource for HDR Japan photos.

Limited edition fine art prints of Okinawa and Japan will soon be available from our members.
